

Misconceptions Report

The 15 most important wrong answers students chose — and how to teach past them
Anugola District · Odisha

ABOUT THIS REPORT

In the 2025-26 SAKSHAM assessment, some wrong answers were not chosen at random. Large numbers of children picked the same wrong option because they share the same wrong idea — a misconception. This report collects the 15 clearest cases from across the district: what each question asked, which wrong answer pulled students in, what that reveals about their thinking, and a practical way to re-teach the idea.

15 misconceptions · Grades **5** and **8** · **6** subjects

Each question was answered by **13,556-14,066** students across Anugola district

HOW TO READ EACH CARD

1. The wrong idea. Every card leads with the misconception, in plain words.
2. The question. The item as students saw it (with the Odia original where available) and all four options. The correct answer and the **most-chosen wrong answer** are marked, each with the share of students who picked it.
3. How to re-teach it. A short, concrete classroom response for teachers.

Percentages are district-wide. They do not add to 100 because some students chose other options or left the question blank. Where a question followed a reading passage, the passage is not reprinted; each card gives the context needed. One question's graph is reprinted on its card.
